

How to fix Windows 10 update issues

Fix Windows 10 update problems:

Running windows update is essential to your computer since it helps your system run smoothly and effectively, and also to ensure that you are getting the latest security updates to protect your computer from harmful threats.

However, there are some of us encountered issues when running the update, if you are one of them. I will show you how to fix this specific issue and get the job done.

1. Check your Disk Space

First of all, we'll tackle and check your disk storage space because this might be the reason why you are unable to run the update. You need to have enough space on your disk to save the necessary files for the update.

This is probably the reason why you can't complete the update process, please follow the steps given below.

1. Please navigate on your **Cortana's** search box and type "**Disk Cleanup**" without any quotation mark, please select the application.

2. Select the appropriate system drive, commonly, the path should be drive letter C:, please wait for the disk cleanup process to be completed, you will then be able to see the amount of space you can free up. Please make sure not to select the important files, once selected, it will be deleted on your system.

2. Windows Update Troubleshooter

If the solution above does not work, you may need to use Microsoft's fix tool, please visit the link provided below.

http://aka.ms/diag_wu

Once you visit the link provided above, you will be able to download the fix tool from Microsoft.

1. Please run the **downloaded fix tool**, install the program by following the on-screen instructions.

2. You will be able to see a screen where you will be asked to select specific file to select and fix, please select **Windows update** and hit **next**.
3. Please wait until the process is done and the issue should be fixed.

4. Delete and re-download

1. Please hold **Windows key** then hit **R** (Windows key+R) to open run application.
2. **Copy** and **paste** the path given below and hit enter.

C:\Windows\SoftwareDistribution\Download

3. You will be redirected to the update download folder, please delete all files inside that folder by holding CTRL+A, and hit delete. (If there are files that you can't delete, please reboot your computer to safe mode and delete the files from there.)
4. After deleting all the files, please do restart your computer and run Windows update again.

5. A malware is stopping the update

A malware program can change or alter important files on your computer system as a result you will be unable to completely run the Windows Update. Therefore, you need to eliminate malware programs, you must run your security or antivirus program. If you don't have a security program or your security program can't seem to detect any issues, I highly suggest using our SecurityReviver program.

<http://reviversoft.com/security-reviver/>

SecurityReviver is designed to scan and locate malware programs on your computer and eliminate the threats.

Furthermore, SecurityReviver has useful features, including Browser Cleaner and Start-up Manager, these features help your computer run smoothly. SecurityReviver is an easy to use utility, hence, it will save you time and most of all, your computer from getting infected by these lurking viruses.

I hope this helps you with the issue you are having!

Happy fixing,

Chris
